

## Vermont Population Projections – 2010 - 2030

August, 2013

Produced by:

**Ken Jones, Ph.D.**, Economic Research Analyst

Vermont Agency of Commerce and Community Development

and

**Lilly Schwarz**, Community Based Learning Intern

Montpelier High School

This project was developed with the assistance and oversight of a committee of State Agency representatives. The Committee reviewed the methodology and results leading to the final figures presented in this report.

### Population Projection Review Committee

Glenn Bailey, Vermont Agency of Education

Mathew Barewicz, Vermont Department of Labor

Sarah Lindberg, Vermont Department of Financial Regulation

Michael Moser, University of Vermont, Center for Rural Studies

Michael Nyland-Funk, Vermont Department of Health

## Vermont Population Projections – 2010 - 2030

### How are Population Projections developed?

Vermont's population projections are based on an age cohort model (defined age groupings such as: 35-39 year-olds) using US Census data as the basis for calculations. Mortality, birth rate and migration rate data from 1990-2010 are factors used to develop the projections.

In general, an age cohort projection model starts with the population total for a particular age group at a given point in time. The Census bureau reports most age cohorts in 5 year groups and thus, five year groups are used in this model. At the end of a ten year period, the population for an age cohort is equal to the beginning population total minus the mortality and plus or minus the migration during the ten year period. For example,

In year 2000, according to the US census, Vermont's 25-29 age cohort population was 34,182. Ten years later, in year 2010, Vermont's 35-39 age cohort population was 36,358 - according to Census reporting. Between 2000 and 2010, about 50 people in that age cohort died (0.15% mortality rate over the ten year period).

By taking into account the population increase and mortality rate for the the age cohort, the migration rate can be calculated.

$$\begin{aligned}\text{Migration} &= 36,358 - 34,182 + 50 \\ &= 2226 \text{ or } 6.51\% \text{ of the } 2000 \text{ five year age cohort}\end{aligned}$$

"Projecting" into the future, would suggest that the 2020 population of 35-39 year olds will equal the 2010 population of 25-29 year olds (35,441) minus mortality (again, about .15%) plus the 6.51% net migration rate. 2020 projected population of 35-39 year olds = 37,700

### Migration

The migration rate for the 2010 to 2020 and 2020 to 2030 decades could be similar to the migration rate for the 2000 to 2010 period or the 1990 to 2000 period. These different migration assumptions are the basis for the two sets of projections presented in this report – Scenario A and Scenario B. In Vermont, there is a relationship between the national economy and the direction and magnitude of migration. During the 1990s (Scenario A), the national economy was generally healthier than during the 2000s (Scenario B) and Vermont saw greater rates of net in-migration. As a result, Scenario A using 1990s migration rates generally, show higher populations than Scenario B using the migration rates of the 2000s.

## Mortality

The mortality rates for age cohorts greater than 50 years old continue to decrease. For the population projections, we use mortality rates that continue the decline. For younger populations, the mortality rate is leveling off and the mortality rates used for the projection do not have the same proportional decreases that other age cohorts exhibit.

## Births

The number of children born during the projection period requires the use of age specific birth rates. The Vermont Department of Health publishes county and age-specific birth rates each year in its Vital Statistics publication. In Vermont, each county is witnessing decreases in the birth rates for teenage women. Birth rates for women in their 20s and early 30s are relatively more stable, while the birth rates for women in older age cohorts continue to increase. As with the mortality rates, these Vermont population projections assume a continuation in the trend in birth rates seen for the past twenty years to provide birth rates for each age cohort into the next twenty years. Unlike mortality, the birth rates in Vermont vary significantly for each county. Therefore, the county projections use county-specific birth rates for each age cohort.

In order to complete the projections for children born during the projection period, there are three steps. The first step is to complete the population projections for females in each county using statewide mortality rates and county and age specific migration rates based on 1990s and 2000s Census data. The second step is to apply the age and county specific birth rates to each projected female age cohort resulting in the number of births during the time period. The final step is to review the migration rates for young children during the 1990s and 2000s and apply those migration rates to the number of births projected from Steps One and Two.

## Normalizing the county and town projections

For all age cohorts, a state projection is completed in addition to one for each county. Because the statistical validity of a projection is greater with larger numbers, the state projection serves as a base against which the county projections are normalized. In other words, for any age cohort, the state projected total is compared against the total of each county cohort. Any differences are normalized by reducing or increasing county figures proportionally to the population size of that cohort in each county. For example, the age 40-44 state population is projected to be 35,561 when assuming the migration pattern of the 2000s. The sum of the county projections for that cohort is 35,570. For consistency, the county population numbers for that cohort are decreased proportionally to result in a county total equal to the state projected figure.

## Town and City projections

The county projections are the basis for determining town and city level projections. As with the county migration rates, the changes in the population for each town that took place in 2000-2010 and 1990 – 2000 combined with the projected changes in county numbers result in an equation to project town populations. Specifically,

2020 Town projected figure = Town population in 2010 + (50% of the rate of town population change from 2000-2010) + (25% of the rate of town population change from 1990 – 2000) + (25% of the rate of county population change from 2000-2010)

2030 Town projected figure = Town population in 2020 + (35% the rate of town population change from 2000-2010)+(15% of the rate of town population change from 1990 – 2000) + (50% of the rate of county population change from 2000-2010)

Similar to normalizing county age cohort figures to correspond to the state projections, town populations are either increased or decreased to assure that the sum of the town populations in a county equal the county population.

## **Caveats when considering the Vermont Population Projections**

### Projections, not predictions

Projections assume that conditions that occurred in the past will continue into the future. For these projections, there are assumptions about mortality rates (continuing a downward trajectory for the next 20 years), birth rates and two sets of assumptions about migration rates. Events may alter the conditions that led to population changes in the past 20 years and those events will affect the changes in population. Examples of changes that are not predicted for these estimates:

- Changes in the birth rate from social changes different than what has occurred in the past 20 years
- Changes in health care practices or epidemics that could affect mortality rates
- Changing economic conditions that result in shifts in national (internal) migration
- Changes in national immigration policies

### Census populations, not the actual number of inhabitants at a given time

Many individuals, particularly those that are retired and those attending colleges and universities have more than one home. The Census Bureau does not have a requirement that individuals determine their residency with a particular set of standards and does not allow any individual to split their residence to multiple towns or states. The residence as of April 1, in the

year the Census is conducted is a standard upon which many people determine their census filing “home”.

In Vermont, individuals that reside in other states such as “snow bird” destinations in the southern United States may not file their Census return from Vermont and yet may be registered to vote in Vermont, hold a Vermont driver’s license, pay taxes or even live the majority of the year in Vermont. Because the Census does not capture the true nature of these residents, the projections may give a misleading estimate on how many individuals reside in a particular community during different times of the year.

#### Statistical limitations

When working with relatively small population sizes, data can be susceptible to fluctuations that may not represent trends, but rather individual, non-replicable events. The margin of error for any statistical calculation increases as the size of the population decreases. These small numbers are evident in some of the small county age cohort projections as well as small town populations.
